

CQC API Integration Workflow

Objective:

To automatically sync care provider and location data from the CQC API while ensuring correct classification, mapping, and validation.

2. L1 → L2 → L3 → L4 Hierarchy Structure

Level	Classification	Source in API	Notes
L1	Residential Home	<code>"inspectionCategories.name": "Residential social care"</code>	Broadest category, confirming the location is a care home .
L2	Care Home	<code>"careHome": "Y"</code>	Confirms the provider is a registered care home.
L3	Care Home Type	<code>"gacServiceTypes.name": "Residential homes" / "Nursing homes"</code>	Specifies whether the care home offers nursing or not .
L4	Care Types / Specialisms	<code>"specialisms"</code>	Defines the specific care services provided, e.g., Dementia, Physical Disabilities.

4. Classifying Residential and Nursing Care Providers

- If `"careHome": "Y"`, it qualifies as a **Care Home**.
- If `"gacServiceTypes.name": "Residential homes"`, classify as **Residential Care (Without Nursing)**.
- If `"gacServiceTypes.name": "Nursing homes"`, classify as **Residential Nursing**.
- If no clear match, flag for **manual review**.

use **getServiceTypes** to identify **Care at home** services as L1 the same way as above (May be L2 and L3 is not needed but Support tasks should be added after Care types for Care at Home).

1. API Data Retrieval & Processing

Step 1: Fetch Data from CQC API

- Use the **CQC API endpoint** to retrieve provider details.
- Query for **Provider Details** and **Location IDs**.
- Fetch **Regulated Activities** and **GAC Service Types** to classify the provider.

Step 2: Transform API Data to Organization Format

- Map API fields to Organization equivalents (See Mapping Table Below).
- Classify the provider as **Residential Care Home Without Nursing or Residential Care home with Nursing** based on "gacServiceTypes".
- Extract **services offered** and matched them to organization's care types. Mark where possible; otherwise, let the user tick them off a list of care types offered.
At least the Registered Care types must be selected
- Convert location data into structured format for onboarding.

Step 3: Validate and Clean Data

- Ensure only **Registered Providers** ("registrationStatus": "Registered") are onboarded.
- Validate mandatory fields:
 - Provider Name
 - Provider ID
 - Location Address
 - [Type of provider](#) ~~Care Services Offered~~
- If any critical fields are missing, flag the record for **manual review**.

2. Mapping CQC API Fields to Organization

CQC API Field

**Organization
Equivalent**

Notes

"providerId"	Organization Provider ID	Unique identifier for the provider
"locationIds"	Location IDs	Each location under this provider
"name"	Business Name	Name of the care provider
"organisationType"	Provider Type	Defines if it's a single provider or a group
"ownershipType"	Ownership Type	Organisation/Individual ownership
"postalAddressTownCity", "postalCode", "localAuthority"	Location Data	Address details
"mainPhoneNumber"	Contact Number	Primary phone contact – provider and for each location
"website"	Website	Provider's website
"registrationStatus"	CQC Registration Status	Only registered providers should be onboarded
"lastInspection.date"	Last CQC Inspection Date	Important for provider credibility – only the latest rating displayed in display cards and the last report link with detailed rating in provider profile
"regulatedActivities"	Care Services Provided	Services offered by the provider

"gacServiceTypes"	Care Home Type	Specifies whether the provider offers residential care with or without nursing
"onspdLatitude", "onspdLongitude"	Location Coordinates	Needed for mapping & search functionality
"numberOfBeds"	Total Beds	Indicates the capacity of the care home
"specialisms"	Specialist Care Provided	Identifies areas like Dementia, Physical Disabilities
"currentRatings.overall.rating"	CQC Rating	Displays the overall inspection rating

3. Classifying Residential and Nursing Care Providers

- If "gacServiceTypes.name": "Residential homes" → Care home (**Without Nursing**)
- If "gacServiceTypes.name": "Nursing homes" → **Residential Nursing**
- **for example, Hillview Care Ltd**

Care types offered

- Residential Care over 65
 - Dementia
 - Over 65
 - Under 65
 - Physical disabilities
 - If no clear match, flag for **manual review**.
 - Capture age group under separate section (Over 65/under65/Young adult)
-

4. Handling Additional Care Services

- Import only **CQC-registered services** automatically.
 - Do not import Care homes/Care at home are marked as archived
 - Allow providers to **manually add extra care types (services)** beyond CQC registration.
 - Unlisted care types are flagged as **“Provider Declared”** with a disclaimer.
(may not be necessary but registered care types must be selected.)
-

5. Multi-Location Provider Handling

- Each "locationId" is treated as an **individual care location**.
- The **main provider account** can manage multiple locations. (Group)
- Locations are listed separately **but linked** to the main Provider.

Subscription Logic for Multi-Location Providers

- **First location = Free.** (For first 6 months and admin should be able to change the period if needed.)
 - Additional locations require a **monthly subscription**.
 - The system auto-detects and applies the correct subscription model.
-

6. Automating Data Import & Review Process

Import Pipeline

1. **Fetch Data** – Query CQC API.
2. **Transform Data** – Convert API fields into Organization’s format.
3. **Validate Data** – Ensure completeness, correct classification, and services mapping.
4. **Auto-Onboard** – If validation passes, provider data is synced.
5. **Flag for Review** – If fields are missing or unmatched, request manual approval.

Admin Review Dashboard

- **Auto-imported providers** appear in the system with a **CQC Verified badge**
 - **Unmatched services or missing fields** are flagged for admin approval.
 - Providers can be onboarded only after final validation.
-

7. Development Considerations

- Ensure the API sync **runs periodically** to fetch new provider data. (For example, if a provider buys a location from another provider or inspection rating changes)
 - Implement a **dashboard for admins** to review flagged providers.
 - Use **background jobs** to process large datasets without slowing the system.
 - Provide a **manual sync option** for instant updates when required.
-

Next Steps

1. **Develop the API Import Script** following this workflow.
 2. **Test Auto-Matching & Flagging Rules** on sample data.
 3. **Set Up Admin Review Dashboard** to handle unmatched entries.
 4. **Deploy and Monitor Data Sync Performance.**
-
